

KISSAN MELA - 2023

The M.Sc. Zoology students attended the Kisan Mela on 29-03-2023 at the Agricultural Research Station, Maruteru. The visit was highly beneficial and informative for the students. It provided practical exposure to modern agricultural technologies, pest control methods, aquaculture practices, and sustainable farming techniques.

The students gained knowledge about the relationship between zoology and agriculture, especially in areas such as insect pest management, animal husbandry, fisheries, and environmental conservation. Interaction with scientists and farmers helped them understand real-time field applications of scientific research.

The programme also improved their practical skills, scientific awareness, communication abilities, and research interest. Such educational visits bridge the gap between classroom learning and field experience, helping students develop a broader understanding of applied biological sciences and future career opportunities.
